PROJECTS

E-COMMERCE COFFEE SITE: Full Stack E-commerce Subscription Coffee Site

Technologies: HTML5, CSS3, JavaScript, Node.js, Angular.js, MongoDB, Express.js

I began with the backend, using Node.js and MongoDB, first to simulate designing an API. I had to resolve the issue of password protection for customers using a node module. A problem that I had to overcome was using Mongoose to add validations on the data that would be added to the database.

I used Angular.js for the frontend for seamless page navigation and Bootstrap for responsiveness.

RATE THE THRONE: Public Restroom Rating Application

Technologies: HTML5, CSS3, JavaScript, Angualr.js, Bootstrap, JQuery

My team resolved the issue of finding a clean place around you to go.

We used the Google Maps API to gather data of local restrooms and built review functionality using Angular and JavaScript.

Our biggest challenge was linking data from our JSON file with the data from Google Maps and passing it to our frontend.

We used SCRUM methodologies for the week to hit our MVP.

DRAW TOGETHER: Web App that allows collaborative drawing and simple Pictionary game capabilities

Technologies: HTML Canvas, Node.js, JavaScript, Socket.io, CSS3

I built the drawing board using HTML Canvas and the chat box using Socket.io. The biggest challenge was finding out what data needed to be passed from the client to the server and vice versa. Backend was built using Node.js and Express.js Live Demo- https://draw-together-ifyfcinztz.now.sh
